Jockey Box Cleaning Instructions

Last updated: May 17th, 2018

Step 1

Flush the beer out of the lines with water by attaching the cleaning kit pump to the rear shanks of the jockey box. Using the pump to force air into the coils, pump out any remaining rinse water.

Step 2

Measure 1 ounce of BLC into the pump reservoir and 2 liters of water (half full). Put the lid back on the reservoir and agitate for a few seconds to mix the cleaner into the water. Pump the cleaner into the coils collecting the run off in a container. Recirculate the run off back through the coils 2 more times, each time allowing the cleaner to stay in the coils for 5 minutes before purging again. **BLC is caustic, and should be handled carefully with proper PPE. Read it's MSDS for full details on safe handling and what to do in case of an accident.**

Step 3

Flush the entire system thoroughly with water.

Step 4

Remove the taps from the front of the jockey box and allow them to soak in the leftover cleaning solution for up to 10 minutes. Clean any noticeable debris away with the brush provided.

Step 5

Reattach the faucets to the jockey box.

Step 6

In the pump reservoir mix together $\frac{1}{4}$ ounce starsan to 1 gallon of water. Pump the starsan into the coils and close the shut off valve once the coils are full. Each coil holds about a pint of liquid so run at least a quarter of the reservoir into the lines to make sure the non sanitized water is completely out of the coil.

Step 7

If the interior of the cooler gets soiled clean the outside of the stainless steel coils with a mild soap. Rinse with clean water and wipe dry. Do the same thing with the exterior of the cooler if needed.
